Veeva Systems — Engineering Development Program
Hiring Team, Raleigh, NC

Dear Veeva Engineering Team,

I'm Ankith Reddy Kasani — an MS Computer Science candidate at NYIT (GPA 3.8/4.0) with 1.5 years of enterprise Java development at Ernst & Young. I'm genuinely excited about the Engineering Development Program, and per your process, here are the questions that matter most to me:

1. How does EDP structure the transition from onboarding to owning production code?

I care about learning fast and delivering real value. I want to understand how quickly EDP engineers are trusted with production-level Java work, and what the mentorship structure looks like in those first months.

2. What does "delivering value early" look like in practice for an EDP engineer's first 90 days?

Your program is designed for rapid growth. I'd love to know what a successful first project typically looks like — is it a feature, a bug-fix cycle, a tooling improvement? What signal tells you an EDP engineer is thriving?

3. How do EDP engineers develop domain knowledge in Life Sciences?

Veeva builds industry-specific cloud software, and I believe great engineers understand the domain they're building for. Are there structured ways for new engineers to learn the Life Sciences context behind the products they contribute to?

4. How does Veeva's status as a Public Benefit Corporation influence day-to-day engineering decisions?

I'm drawn to Veeva specifically because of the PBC mission. I'd like to understand whether that "do the right thing" value shows up in technical choices — architecture decisions, data practices, how tradeoffs are handled — or whether it primarily lives at the business level.

5. How does the Raleigh engineering office collaborate with other Veeva engineering locations?

I want to understand the day-to-day reality of being part of a globally distributed engineering org while being in-office in Raleigh — how connected are local teams to product decisions and the broader engineering culture?

Thank you for designing a hiring process that is fast, direct, and respectful of candidates' time — it reflects the values you describe on your website. I would be glad to bring the same discipline and integrity to your engineering team.

Sincerely,

Ankith Reddy Kasani
